2.
  - a. useState is a function used to add variables with state in react functional components.
  - b. Prop drilling:- It refers to the process of passing data through multiple nested components.  
State lifting :- Instead of each component having its own state, the state is lifted up to their closest common ancestor and passed down.
  - c. Key :- It is a special string attribute you need to include when creating lists of elements. Keys are used to identify which items in the list are changed, updated, or deleted.
  - d. SyntheticEvent is a cross-browser wrapper that links with the browser's native event. It gives cross-browser compatibility.
  - e. Virtual DOM is a lightweight javascript copy of DOM used to efficiently update the DOM. When a change is made a new VDOM is created and compares with DOM to make only necessary changes.
